

areo

smart living
that feels **natural**

areo

Welcome to the areo smart home system. Four parts of a house – entry, security, lighting and climate – planned together and made to behave as one. Every product is made for Indian homes and Indian wiring, and the range keeps growing.

A house gets every detail. Then life gets in the way.

areo began with a simple thought. Technology already sits at the centre of everyday life, so it ought to earn that place by making the day easier rather than busier.

A home is an emotion. Built from the ground up or moved into ready-made, every detail gets argued over – the light above the dining table, the fall of a curtain, where the switches go.

Then people move in, and parts of the house quietly stop being used. A curtain stays open because drawing it means crossing the room. A corner never gets lit because its switch is somewhere else. Nothing was designed badly. Using it simply takes more effort than it is worth.

That is where areo comes in – the last layer, the one that gives a house back the life it was designed for.

Vision

To be the range that every kind of residential space in India can be built around.

Mission

No two homes are alike, so the range is made to be combined rather than bought as a set. Every product stands on its own and works as part of the whole.

Core Values

Quality first. Hardware built to last in Indian conditions, and a range that behaves the same way in every home it goes into.

Lighting

Light that moves with the hour and the occasion. Low for an evening, bright for a working morning, set once and brought back with a touch.

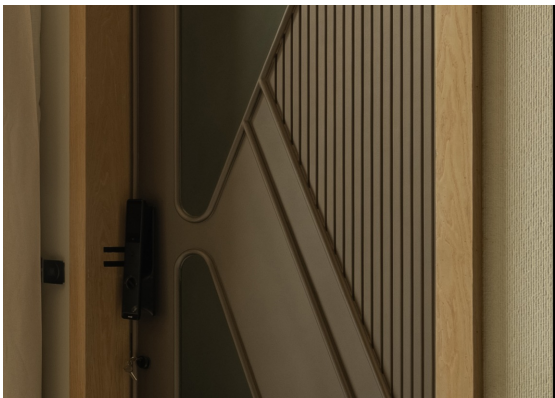

Climate

Cooling, ventilation and air quality held where they should be through the day, without anyone reaching for a remote.

Security

Cameras, sensors and alerts watching the house while you are in it and while you are away, all answering to one place.

Entry

Doors that open to a fingerprint, a code or a phone, and keep a record of who came and when.

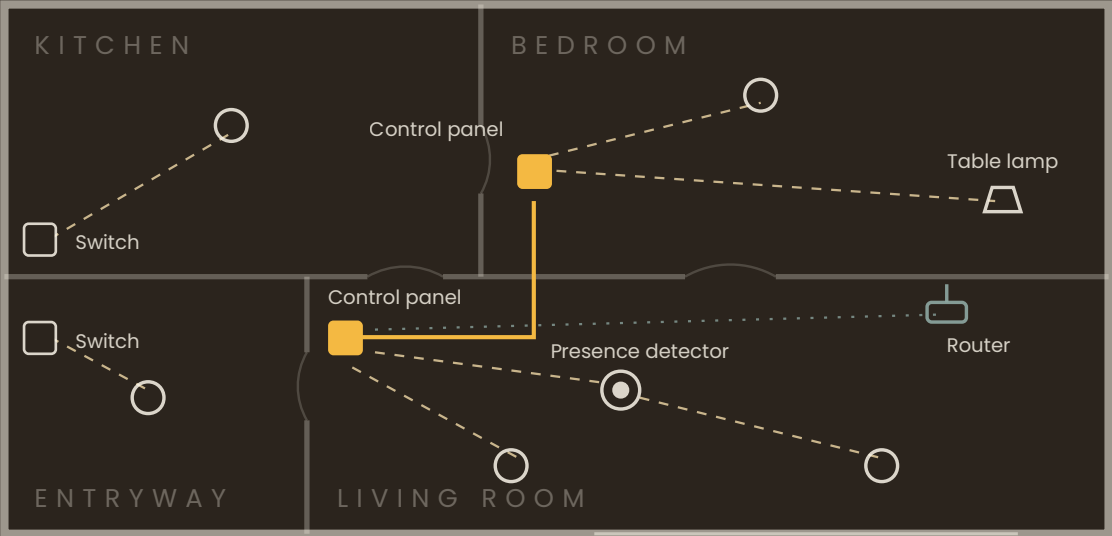

Lighting | Illuminate Life

Light does more than make a room usable. It decides how that room feels at seven in the morning and at ten at night. areo's lighting system runs over both wired and wireless connections, covering switching, dimming, colour and

whole-room scenes – controlled from a panel on the wall, a physical button, a phone, or by voice.

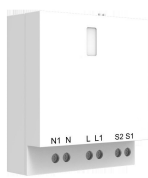

Smart Home Control Panel

The panels are both controller and gateway. Over ZigBee they hold the lights and switches around them, so an entire room can be set as a scene and brought back with one touch.

Smart Switches and Touch Panels

Plates that take the place of conventional switches and sockets and keep the look of an ordinary switchboard. Every key still works under the finger, and the same circuits can be scheduled or run from a phone.

Retrofit Modules

A module that sits behind a switch or socket already on the wall and brings that circuit onto the system. Nothing changes at the switch plate; what changes is that the circuit can now be controlled remotely and triggered by other devices.

Smart Motion Sensor / Human Presence Detector

Paired with the lighting, the sensor takes care of the rooms nobody remembers to switch off. Lights come up as someone walks in and fall away once the room has been empty a while. At night, movement where there should be none can bring the whole floor on at once.

Climate | Embrace Cozy Comfort

Comfort is mostly a matter of the house acting before anyone notices. areo's climate system covers cooling, ventilation and air quality, and connects over wired, ZigBee, Wi-Fi or infrared – so it works with

the split units, VRF and fan coil systems already specified for the building rather than asking anyone to change them.

Shade Motor (ZigBee)

One motor handles draw curtains, roller blinds and venetians. Set it to open at first light and the room wakes with the sun. Set it to close once the house is empty and the glass stops heating the room through the afternoon, with the added benefit that nobody can see in.

Smart Air Quality Detector & Smart Temperature and Humidity Sensor

Between them, the two read what the air in a room is really doing. The monitor picks up pollutants and allergens; the sensor tracks temperature and humidity. Either can be used as a trigger for the cooling or the ventilation rather than simply reporting a number.

Fan Coil / Heating Thermostat (ZigBee)

Holds a room at temperature and builds a schedule around the hours it is actually used, so cooling runs when people are there and eases off when they are not. Comfort goes up and running cost comes down.

Central AC Controller – Outdoor / Indoor

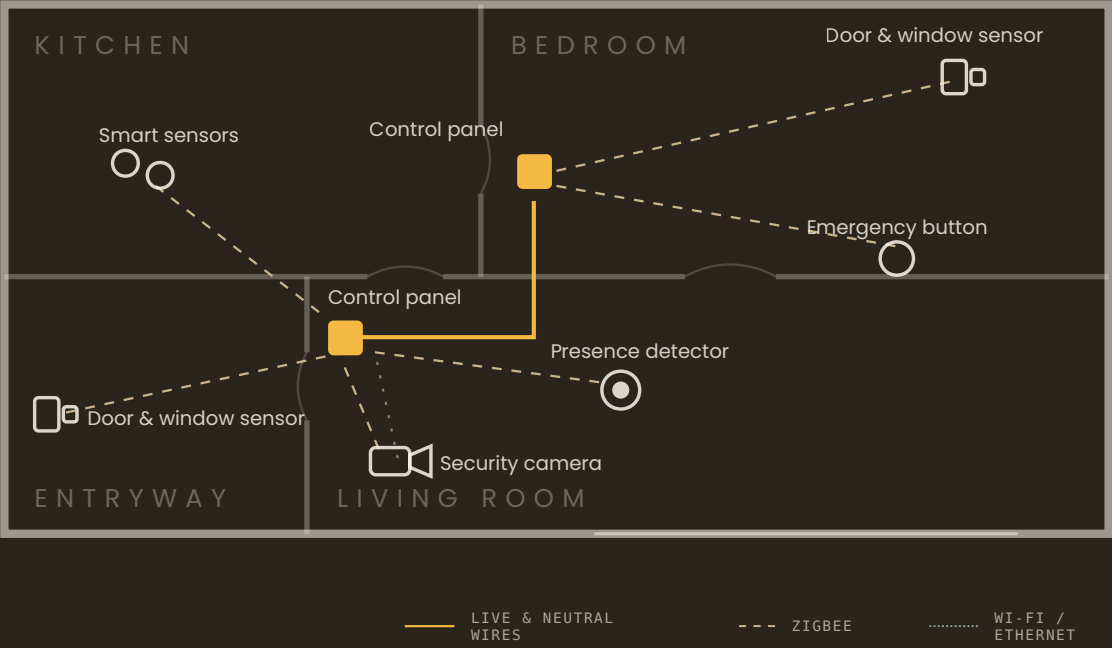

A gateway that brings several VRV/VRF units under one control, whether that is the home system or a building management system. It connects over RS485, KNX or UART, depending on what the plant already speaks.

Security | Create a Haven of Peace

areo's security system puts alarm monitoring, intrusion detection and video surveillance on one footing. When something is wrong it acts at once. The alert reaches your phone, and in a building with an estate

team it reaches them too – so somebody is on their way while you are still reading the notification.

Smart Sensor

A family of sensors covering water and gas leaks, carbon monoxide, smoke, doors and windows, human presence, temperature and humidity.

Smart Emergency Button

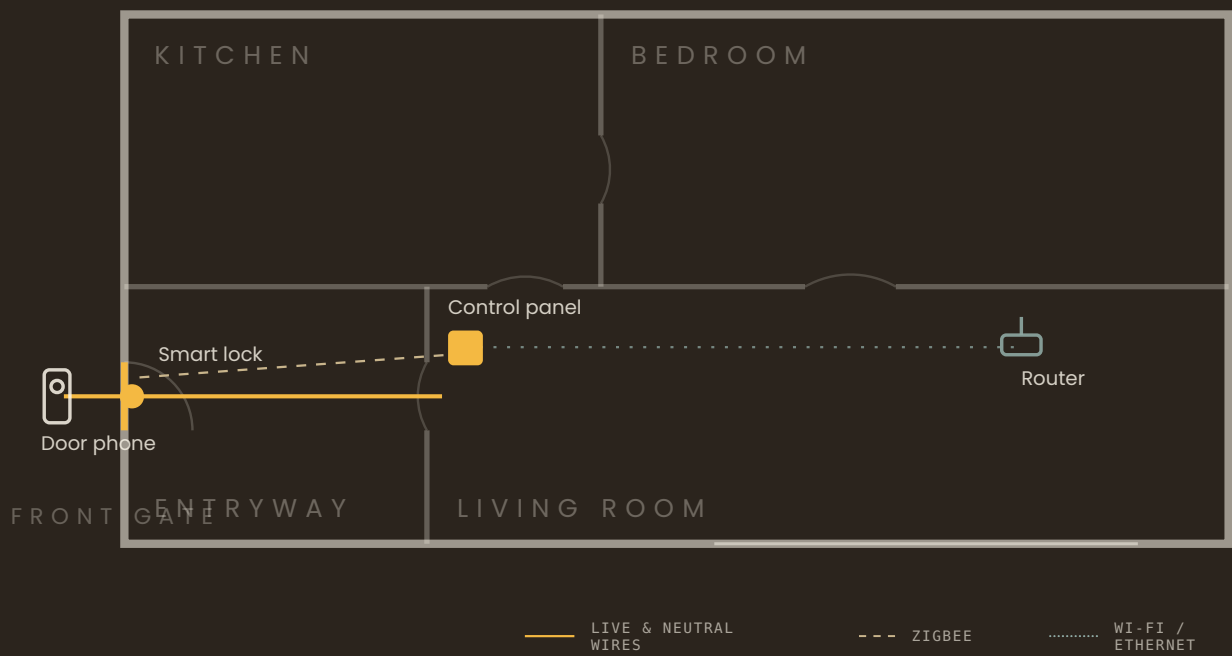

A portable button that calls for help in a single press. Worth keeping within reach of anyone in the house who might need it.

Entry | Where Smart Home Living Begins

areo's entry system puts the intercom and the smart home on the same screen. See who is at the gate, speak to them and let them in from wherever you happen to be standing – or from

another city. Setting it up is deliberately simple, so that everyone in the household actually uses it rather than one person in the family.

Smart Video Intercom

Door stations built on SIP and Android, with call quality good enough to recognise a face and a voice at the gate. Entry can be granted by app, Bluetooth, face, card, or a QR code sent to a guest ahead of their visit.

Smart Lock

Fingerprint, code, card or phone – and a one-time password for a guest or a delivery. The lock tells you when someone rings, keeps a log of every time it has been opened and by whom, and warns you well before the batteries run down.
